Overview of AdventureWorks Database

19 November 2025 15:27

The AdventureWorks 2022 database is a demo database whose data we used to practice our SQL and data analysis skills for the interim project.

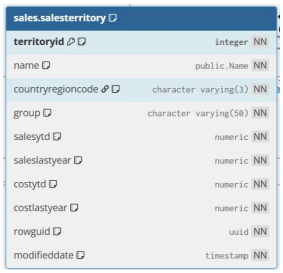
The simulated company is thought to manufacture bicycles based on information in the Production.Product table.

The database consists of tables organized into 5 main schemas:
Person
HumanResources
Production
Purchasing
Sales

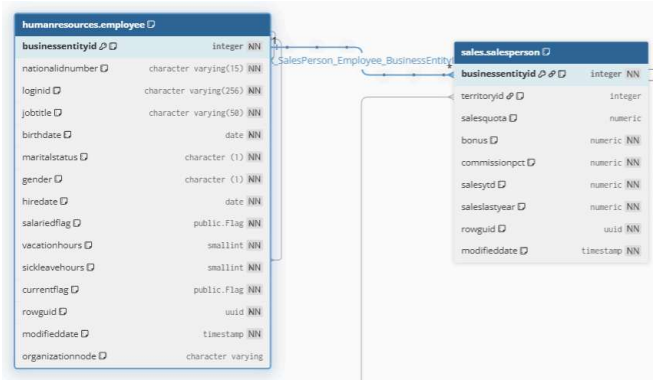
Some questions required information to be retrieved from more than one schema in order to build a dataframe that could be used to answer the questions provided. To do this, tables from different schemas were joined via corresponding Primary Keys.

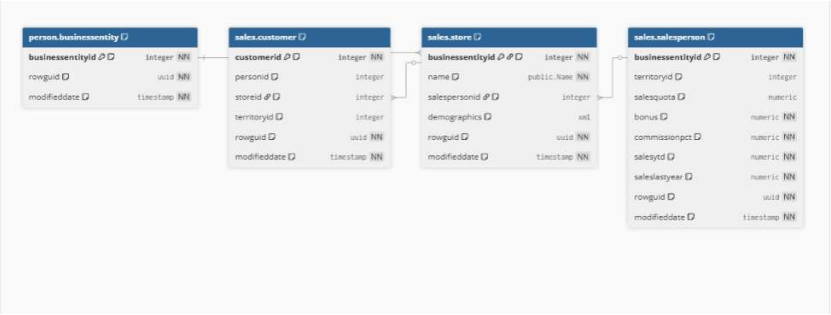
The following entity relationship diagrams show how relationships between relevant tables were identified for each question:

Question 1 & question 3



Question 2





Question 6
